Introduction:

REACTJS DEVELOPMENT was the main goal of this assignment. There are several programming languages used to create web-based applications or software. Some are just utilized for the application's UI and frontend, while others are used for the software's backend. Some programming languages for developing the frontend of an application include HTML3, HTML4, HTML5, CSS, and the Bootstrap Framework. The backend uses PHP, Java, and other programming languages. Currently, the status of several frameworks varies greatly. Frameworks use model, view, and controller to create structured programming. MVC is another name for it. If we create a web-based application, we will be able to access it from any location on the planet. It is really useful in our everyday life. That is why the theme of my report is "REACTJS DEVELOPMENT." This is because all the development was done using ReactJS. Resolving real-world problems was another prominent issue. This report contains all of the material and experience gathered during the internship in REACTJS DEVELOPMENT.

Bagcampus is a Project-Based Learning and hiring solution which aims to give a digitized solution for Recruitment and help candidates to build projector skills, Building a system that helps make recruitment easy by providing technological aspects with college/universities, students and companies where they can find a best-suited candidate for there openings using our free job posting, E-resume, dashboard which make it easy for choosing the best fit for the role. Bagcampus Platform Help Learn and Explore Opportunities in Various Technical and Non Technical Domains.
